CREATION PHOTOGRAMMETRY MODEL FOR DESIGNING A CONSTRUCTION SITE PLAN

Robertas Kontrimovičius

PhD student

Department of Construction Management and Real Estate Faculty of Civil Engineering Vilnius Gediminas Technical University

Presentation agenda

I part – the main steps of creation BIM model

II part – creating photogrammetry model

III part – creating Construction site plan, using photogrammetry model

l part

The main steps of creation BIM model

Before starting the design work, we have to decide – whether **the project model** will be implemented using BIM.

We need to:

- 1. choose the BIM software
- 2. create BIM Execution Plan (BEP)
- 3. create CAD standards
- 4. create or choose classification etc.

CLASSIFICATION

Classifying data means structuring it in an agreed way so that different actors can easily find what they need and understand it. A classification system is like a common language. In BIM, classification lets people, software and machines share and use building information efficiently and accurately.

The importance of classification is growing as teams for building projects get more complex and international, and as projects themselves generate more and more data which is then relied on to automate processes, make better decisions and operate devices.

Different classification systems have been developed for different types of BIM data and actors, and for different geographic areas and situations. Below are some examples.

Uniclass 2015	Uniclass 2015 is a unified classification for the UK industry covering all construction sectors.
OmniClass	The OmniClass Construction Classification System (known as OmniClass™ or OCCS) is a classification system for the construction industry.
MasterFormat [®]	MasterFormat [®] , a publication of CSI and CSC, is a master list of numbers and titles classified by work results.
UniFormat™	UniFormat [™] , a publication of CSI and CSC, is a method of arranging construction information based on functional elements, or parts of a facility characterized by their functions, without regard to the materials and methods used to accomplish them.
CoClass	CoClass Swedish classification system for the built environment.
CCS	CCS Danish classification system for the built environment.
TALO 2000	TALO 2000 Finnish classification System
NS 3451 & TFM	Norwegian classification System
Industry Foundation Classes	Industry Foundation Classes (IFC) are the buildingSMART data model standard.
Building SMART	The buildingSMART Data Dictionary (bSDD) is a library of objects and their attributes.
ETIM	The international standard for uniform classification of technical products.

Correctly created BIM model and marked elements help in finding collisions and to make correct valuation

For different needs, we can extract the elements and perform verification

Exporting the generated schedule to the 3D platform. In the case of errors or collisions – costs at the early stages of the project are smaller than at the stage of construction.

ll part

Creating photogrammetry model

Creation the photogrammetry model

Video source: https://www.youtube.com/watch?v=dtYQhjl_Oxw&list=PLMxDUk91MUDTYI8Uc70w1BWqfU9nkpTsJ

Points marked on construction site by which the photogrammetric model is associated with the geographical coordinates (LKS)

Methods of making photos

Ring 1: 56 photos Orto: 315 photos

Ring 2: 146 photos TOTAL: 517 photos

201812Production 6.3mx

Created model for apartaments

Uploading the IFC model to a photogrammetric model

Collision detection

Collision detection

III part

Creating construction site plan, using photogrammetry model

Converting buildings from point clouds to solid objects

Simplifying the Model (1)

Identification of objects affecting the organization site plan and construction technology. Conversion of buildings from point clouds to SOLID objects.

Identification of existing buildings and access roads as well as other engineering networks.

Simplifying the Model (2)

Conversion of data from the photogrammetry model into a simplified model in which the measurement occurs and the result is generated graphically.

100,0m

145.0m

The start of planning the construction site plan: Tower crane Selection

Algorithms of automated selection a tower crane

Selection and design of construction site temporary fencing, containers, temporary roads, etc ..

Analysis and selection the building technology

Optimized construction site plan, created using virtual reality technology

Due to different technological processes, you can not make one universal model for planning construction site

We must create separate construction site plans at every building stage:

- clean up the area before construction starts;
- earthworks;
- zero stage;
- ground structures;
- installation and electrotechnical works;
- finishing works;
- land development
- other
